|                                                                                   |     |
|-----------------------------------------------------------------------------------|-----|
| Preface                                                                           | vii |
| <b>The Principle of Least Action in Quantum Mechanics</b><br><i>R. P. Feynman</i> |     |
| I. Introduction                                                                   | 1   |
| II. Least Action in Classical Mechanics                                           | 6   |
| 1. The Concept of Functional                                                      | 6   |
| 2. The Principle of Least Action                                                  | 9   |
| 3. Conservation of Energy. Constants of the Motion                                | 10  |
| 4. Particles Interacting through an Intermediate Oscillator                       | 16  |
| III. Least Action in Quantum Mechanics                                            | 24  |
| 1. The Lagrangian in Quantum Mechanics                                            | 26  |
| 2. The Calculation of Matrix Elements in the<br>Language of a Lagrangian          | 32  |
| 3. The Equations of Motion in Lagrangian Form                                     | 34  |
| 4. Translation to the Ordinary Notation of Quantum<br>Mechanics                   | 39  |
| 5. The Generalization to Any Action Function                                      | 41  |
| 6. Conservation of Energy. Constants of the Motion                                | 42  |
| 7. The Role of the Wave Function                                                  | 44  |
| 8. Transition Probabilities                                                       | 46  |
| 9. Expectation Values for Observables                                             | 49  |
| 10. Application to the Forced Harmonic Oscillator                                 | 55  |
| 11. Particles Interacting through an Intermediate Oscillator                      | 61  |
| 12. Conclusion                                                                    | 68  |
