

Contents

1	Linear Systems: Elimination Method	7
1.1	An Example of the Basic Problem	7
1.2	Two Instructive Examples	8
1.2.1	Covering a Sphere with Hexagons and Pentagons	8
1.2.2	A Chemical Reaction	11
1.3	Homogeneous Systems: Terminology	16
1.4	Elimination Algorithm	18
1.4.1	Comparison of the systems (S) and (HS)	20
1.5	Appendix	21
1.5.1	Potentials on a Grid	21
1.5.2	Another Illustration of the Fundamental Principle	23
1.5.3	The Euler Relation $f + v = e + 2$	24
1.5.4	Fullerenes	25
1.5.5	Radiolarians	25
1.6	Exercises	26
2	Vector Spaces	27
2.1	Definitions and Examples	27
2.2	Subspaces, Generators	29
2.3	Linear Independence	32
2.4	Bases, Dimension	35
2.5	Appendix	38
2.5.1	Set Theory, Notation	38
2.5.2	Axioms for Commutative Fields K	41
2.5.3	Axioms for Vector Spaces E	41
2.6	Exercises	42
3	Matrix Multiplication	43
3.1	Row by Column Multiplication	43
3.1.1	Linear Fractional Transformations	43
3.1.2	Definition of the Product of Matrices.	44
3.1.3	Linear Map Produced by Matrix Multiplication.	47
3.2	Row Operations and Matrix Multiplication	48
3.2.1	Elementary Matrices	48
3.2.2	Inversion of Matrices	49
3.2.3	Inversion Algorithm	50
3.2.4	Simultaneous Resolution of Linear Systems.	51
3.3	Matrix Product by Blocks	52

3.3.1	The Field $\mathbf{C}$ of Complex Numbers	54
3.3.2	The Field $\mathbf{H}$ of Quaternions	55
3.4	Appendix: The Strassen Algorithm	56
3.5	Exercises	56
4	Linear Maps	59
4.1	Linearity	59
4.1.1	Definition and First Properties	60
4.1.2	Examples of Linear Maps	61
4.2	General Results	62
4.2.1	Image and Kernel of a Linear Map	62
4.2.2	Defining Linear Maps	63
4.2.3	Matrix Description of Linear Maps	64
4.3	Results Concerning Dimensions	67
4.3.1	Dimensions of Kernel and Image	67
4.3.2	Row-Rank versus Column-Rank	68
4.3.3	Regular Matrices	69
4.4	Isomorphisms	70
4.4.1	Generalities	70
4.4.2	Models of Finite-Dimensional Vector Spaces	71
4.4.3	Change of Basis: Components of Vectors	72
4.4.4	Change of Basis: Matrices of Linear Maps	73
4.4.5	The Trace of Square Matrices	73
4.5	Appendix	74
4.5.1	Inverting Maps between Sets	74
4.5.2	Another Proof of Invertibility	75
4.6	Exercises	76
5	The Rank Theorem — Varia	77
5.1	More on Row- versus Column-Rank	77
5.1.1	Factorizations of a Matrix	77
5.1.2	Low Rank Examples	78
5.1.3	A Basis for the Image	79
5.1.4	An Isomorphism between Row- and Column Spaces	80
5.2	Direct Sum of Vector Spaces, Projectors	80
5.2.1	Sum of Vector Spaces	80
5.2.2	Generalized Projectors	82
5.2.3	Tricks of the Trade	85
5.3	Pyramid of Ages	86
5.4	Color Theory	87
5.5	Genetics	90
5.6	Einstein Summation Convention	91
5.7	Exercises	92
6	Eigenvectors and Eigenvalues	95
6.1	Introduction	95
6.2	Definitions and Examples	96
6.2.1	Definitions	96
6.2.2	Simple 2×2 Examples	97
6.2.3	A 4×4 Example	98

6.2.4	General Examples	100
6.3	General Results	102
6.3.1	Localization of Eigenvalues	102
6.3.2	Estimating the Number of Eigenvalues	103
6.3.3	Another Method for Finding Eigenvectors	104
6.3.4	Eigenvectors and Commutation	105
6.4	Applications of Eigenvectors	106
6.4.1	An Example: The Fibonacci Numbers	106
6.4.2	Diagonalization	109
6.5	Appendix	111
6.5.1	Eigenvectors of AB and of BA	111
6.5.2	A Leslie Matrix	111
6.5.3	Fibonacci Numbers Again	111
6.5.4	Complements on Fibonacci Numbers	112
6.6	Exercises	113
7	Inner Product Spaces	115
7.1	About Multiplication and Products	115
7.1.1	From Planar Geometry to Inner Products	116
7.1.2	Inner Product in $\mathbf{R}^n$	118
7.1.3	Cross product in $\mathbf{R}^3$	119
7.2	Abstract Inner Products and Norms	121
7.2.1	The Cauchy-Schwarz-Bunyakovskii Inequality	122
7.2.2	The Pythagorean Theorem	122
7.2.3	More identities	124
7.3	Euclidean Spaces	124
7.3.1	Existence of Orthonormal Bases	125
7.3.2	Best Approximation Theorem	125
7.4	Linear Regressions: Mean Squares Method	127
7.5	Orthogonal Subspaces	130
7.6	Appendix: Finite Probability Spaces	131
7.7	Exercises	137
8	Symmetric Operators	139
8.1	Definition and First Properties	140
8.1.1	Intrinsic characterization of symmetry	140
8.1.2	General Properties of Symmetric Operators	141
8.2	Diagonalization	142
8.2.1	Existence of Eigenvectors	142
8.2.2	Inductive Construction	143
8.2.3	Back to Image and Kernel	143
8.3	Application 1: Quadratic Forms	144
8.4	Application 2: Classification of Quadrics	145
8.5	Application 3: Principal Axes and Statistics	148
8.6	Exercises	149

9 Duality	151
9.1 Introduction	151
9.1.1 Duality for Platonic Solids	151
9.1.2 The Pappus Theorem and its Dual	152
9.1.3 The Theorems of Pascal and Brianchon	152
9.2 Dual of a Vector Space	153
9.2.1 Examples of Linear Forms	153
9.2.2 Dual Bases	154
9.2.3 Transposition of Linear Maps	155
9.2.4 Bidual of a Vector Space	157
9.3 Dual of a Normed Space	158
9.4 Dual of a Euclidean Space	161
9.5 Exercises	162
10 Determinants	163
10.1 From Space Geometry to Determinants	163
10.2 Volume Forms in Vector Spaces	168
10.2.1 Properties of Volume Forms: Uniqueness	168
10.2.2 Construction of Volume Forms in $\mathbf{R}^n$	170
10.3 Determinant of an Operator	172
10.4 Some Examples	176
10.5 Symbolic Determinants	181
10.6 Changing the Field of Scalars	184
10.7 Supplementary Examples	186
10.8 Exercises	189
11 Applications	193
11.1 The Characteristic Polynomial	193
11.2 The Spectrum of an Operator	195
11.3 Cramer's Rules	198
11.4 Inversion of a Regular Matrix	199
11.5 Construction of Orthonormal Bases	201
11.6 A Few Important Theorems	203
11.7 Covariant Components	207
11.8 Exercises	208
12 Normal Operators	209
12.1 Orthogonal Matrices	209
12.2 Transposition and Normal Operators	213
12.3 Anticommutation Relations	216
12.4 Hermitian Inner Products	217
12.5 Mean Squares Method Revisited	221
12.6 Heisenberg Uncertainty Relations	222
12.7 Appendix: Isometries	223
12.8 Exercises	225

13 Tables—Axioms	227
13.1 Axioms for Commutative Fields K	227
13.2 Axioms for Vector Spaces E	228
13.3 Summary for the Cross Product in $\mathbf{R}^3$	228
13.4 Summary of Axioms	230
13.5 Greek Alphabet	231
14 Answers to selected exercises	233
